

Stop the dumping of radioactive water from Fukushima, Japan!

Japan's dumping of nuclear waste from Fukushima is not just a problem for Korea and Japan, but a problem for all humanity, and we must all fight together to stop it.

Japan has already discharged nuclear-contaminated water three times.

Research has shown that 67% of the radioactive caesium released in large quantities during the 2011 accident at Japan's Fukushima Daiichi nuclear power plant is still in the surrounding forests, flowing into rivers and other sources. Many people suffer from this radioactive contamination and have left the area because they can no longer live there.

By discharging contaminated water into the sea, Japan is violating the London Convention and Protocol, which were drawn up at its request. Discharging contaminated water is a selfish and irresponsible act.

The ocean is a common treasure that must be shared and protected by all the world's peoples.

We call on the Japanese government to put an end to this environmental disaster and to address the nuclear issue responsibly to prevent serious negative impacts on the environment, lives, health, and livelihoods .
